There is no established consensus on what constitutes an appropriate annual publication output for scientists, let alone any widely accepted threshold for the maximum number of papers one should publish in the same journal each year. But WANG's number is concerning. Her output in Water Research during the first eight months of 2025 already exceeds her total publications in the same journal for all of 2024.

The 5GH Team does not allege that Water Research's editorial board engaged in improper practices. On the contrary, Dr. Mark van Loosdrecht and other editorial members have consistently demonstrated a commitment to transparent dialogue with the scientific community regarding their publishing standards. The team raises these concerns solely to foster a more substantive discussion about publication ethics within the field.
